DOCUMENTATION 1
CORPORATE WEBSITE — TECHNOLOGY STACK AND LOGIC

Project: LLP “COMPETENCE CENTER” corporate website

Purpose: present the company, its legal services, team and contacts, and provide a direct entry point to the Telegram consultation bot.

1. Technology Stack

- HTML5 — structural markup of the website: sections, headings, text blocks, navigation, buttons, links and content.
- CSS3 — visual presentation: typography, spacing, sizing, positioning, colors, component styling and page layout.
- JavaScript — client-side interactivity and behavior of interface elements.
- Bootstrap 5 — responsive layout and reusable UI components, allowing the website to adapt to desktop and mobile screens.

The selected stack is lightweight and appropriate for a corporate landing page that must be easy to maintain.

2. Website Structure

- Home — company value proposition, brief description of services and a call-to-action button.
- About the Company — company history, mission and working principles.
- Our Services — structured presentation of contract law, court representation, corporate legal support and document review.
- Team — profiles of the director and lawyers with their areas of specialization.
- Contact Us — office address, working hours and a prominent link to the Telegram bot.

3. Website Logic

The website is primarily a client-side presentation system. The browser requests the page resources from the server, receives HTML, CSS, JavaScript and visual assets, and renders the final interface.

Basic flow:

```
User → Browser → Web Server → HTML/CSS/JS/Bootstrap → Rendered Website
```

After the user selects a service or reads the company information, the main conversion action is the consultation request. The Contact/Call-to-Action button redirects the user to the Telegram bot.

```
Website → Book a Consultation → Telegram Bot
```

4. Responsive Logic

Bootstrap 5 grid and responsive classes are used so that the same page can reorganize its sections for different screen widths. On desktop, content can be arranged in several columns; on mobile, blocks can be stacked vertically.

5. SEO and Content

Basic SEO preparation includes page metadata and clear descriptions of the company and its services. The content is organized so a visitor can quickly understand what the legal company does and how to contact it.

6. Testing

- Cross-browser check in Chrome and Safari.
- Responsive checks on mobile screen sizes.
- Verification of navigation, buttons, links and content presentation.

7. Role in the Overall System

The website is the public-facing marketing and information layer. It does not need to implement the full consultation workflow itself. Its main role is to explain the company and transfer an interested visitor to the Telegram bot, where the booking process is automated.

8. Summary Architecture

```
CLIENT
